Teaching experience

I have broad teaching experience in economics and finance at both the undergraduate and graduate levels at Brandeis University. I have served as the primary instructor for four undergraduate course sections and as a teaching assistant for six courses. These positions have required frequent communication with students from different majors, academic backgrounds, and levels of preparation.

As an instructor, I taught *Introduction to Microeconomics* from 2024 to 2026 and *Oral Communication in Economics Practicum* in Fall 2024. I have also served as a teaching assistant for the graduate courses *Applied Econometrics*, *Venture Capital and Entrepreneurial Finance*, and *Modern Finance, FinTech, and Beyond*, as well as the undergraduate course *Industrial Organization*. I have consistently received strong student evaluations across these roles.

My academic training covers microeconomic and macroeconomic theory, econometrics, asset pricing, corporate finance, and industrial organization. I am prepared to teach a wide range of undergraduate and master's-level courses in economics and finance and to work with students with different academic interests. I can also advise students interested in finance research or further study. In addition, I would be interested in teaching courses in entrepreneurship, applied empirical methods, and FinTech.

Teaching philosophy

My teaching philosophy is based on the belief that education in economics, finance, and business should connect theoretical knowledge with practical applications. Students should not only understand economic models but also be able to use them to explain the decisions made by individuals, firms, and policymakers. The rapid development of artificial intelligence has transformed how students acquire knowledge by providing quick, though not always reliable, answers when they encounter difficulties. I believe that students must learn to evaluate AI-generated results critically and distinguish reliable conclusions from incorrect or misleading ones.

With the teaching purpose outlined above, I have developed several guiding principles that shape both my past and future teaching:

1 Teaching as continuous learning. I view teaching as an evolving process and regularly adjust course content and assignments in response to students' feedback and performance. For example, in *Introduction to Microeconomics*, I incorporated more qualitative analysis and case studies after the midterm, giving students a change of pace following an intensive examination period.

2 Interactive learning. From my own experience as a learner, I have found that explaining concepts to others is one of the most effective ways to deepen knowledge and assess understanding. I therefore incorporate activities such as facilitated group discussions, presentations, and question-and-answer sessions. These activities encourage students to collaborate and to learn by teaching and engaging with one another.

3 Connecting theory to real-world examples. Students understand economic theories more effectively when they can relate them to practical situations, so I frequently use real-world examples to illustrate key concepts. For instance, I discuss OPEC and oil prices when examining price controls and use Facebook's acquisition of Instagram to demonstrate the importance of market definition in merger analysis.

4 Using AI responsibly. I aim to teach students how to use AI thoughtfully and responsibly, rather than discouraging the use of it. This is particularly important in introductory courses, where AI-generated responses may incorporate concepts and methods beyond students' current level of understanding. In *Introduction to Microeconomics*, for example, I ask students to show each step of their calculations and compare their reasoning with the methods taught in class. This approach helps students critically evaluate AI-generated answers rather than accepting them without verification.
